

HWiL's Sustainability

Every forward looking company, business, organization or entertainment operation, is now looking at themselves, to make sure that their operational model, is "fully aware and completely respectful of the environment, and is therefore fully sustainable." HWiL is dedicated to sustainability and lies at the forefront of our rN automatic composting machines.

Key Sustainability Points

-  Huge reduction in carbon footprint, zero requirement for landfill and promoting a vastly improved environmental agenda.
-  Our composting technology uses a natural aerobic process, it does not add to the vast build-up of greenhouse gases and it uses oxygen and produces no methane.
-  HWiL's rN composting machines only require electric for their daily use and no other consumable, including no water usage. Solar panels can be used to provide a sustainable electric source.
-  Reduces waste by up to 80-90% & therefore leaves 10-20% residue as a highly nutritious compost/ fertiliser to be re-used on the ground, ie. to grow more food.
-  Processes and composts ALL ORGANIC & BIODEGRADABLE WASTE, and doing so in a fully sustainable way.
